

Influenza Surveillance Report

Division of Epidemiology - Disease Surveillance and Investigation
 District of Columbia Department of Health

2012-2013 Influenza Season Week 12 (March 17, 2013– March 23, 2013)

(All data are preliminary and may change as more reports are received)

SUMMARY

- 6 cases of Influenza were reported by hospitals during this reporting period.
- Zero pediatric-deaths associated with Influenza were recorded during this reporting period.
- For the 2012-2013 Influenza Season to-date, 733 positive Influenza cases have been reported.

INFLUENZA SURVEILLANCE FROM HOSPITALS & AMBULATORY CARE FACILITIES

District of Columbia hospitals and laboratories report detailed information on cases of Influenza on a daily basis. However, in accordance with CDC guidelines, only Influenza-associated deaths in cases <18 years of age and Novel Influenza A infections are reportable.

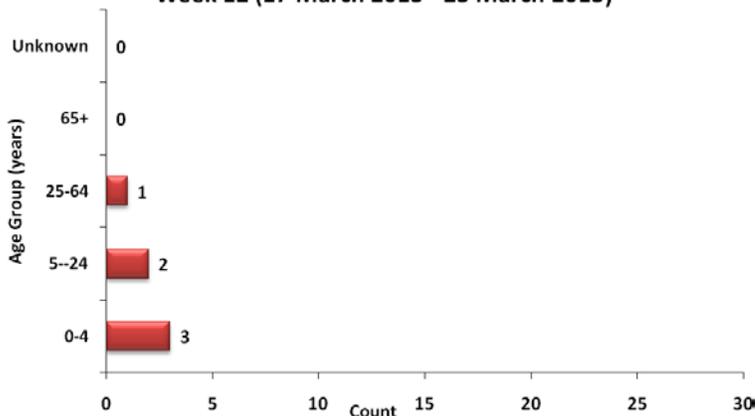

The table below summarizes weekly and cumulative cases of Influenza for the 2012-2013 Season. Data are also presented by age group and by number of cases reported weekly. During week 12 (March 17, 2013– March 23, 2013), there were 6 new cases of Influenza reported. To date, the District has received 733 positive Influenza cases among DC residents reported by hospitals.

Surveillance of Influenza Cases Reported By Influenza Type

	Week 12 (March 17, 2013– March 23, 2013)		Cumulative Cases for Weeks 40 – 22 (30 September 2012 – 1 June 2013)	
Influenza A	1	(17%)	553	(76.0%)
Influenza B	5	(83%)	158	(21.0%)
Influenza A/B	0	(0%)	22	(3.0%)
Influenza (not typed)	0	(0%)	0	(0%)
Total	6*	(100%)	733*	(100.0%)

*Includes results from Rapid Diagnostic Testing, Viral Culture, RT-PCR, Serology, and Immunofluorescence.

Positive Influenza Tests, by Age Group Week 12 (17 March 2013 - 23 March 2013)

Positive Influenza Tests by Week September 30, 2012 - June 1, 2013

RAPID DIAGNOSTIC TESTING

Rapid Diagnostic Tests are screening tests used to detect the Influenza virus in a short period of time. While initially less accurate than PCR and viral culture, rapid diagnostics are more accurate as the Influenza season progresses. During week 12, 93 tests out of a total of 98 were performed using Rapid Diagnostic Testing in clinical laboratories. Of these, 5 (5.4%) positive Influenza specimens were identified during week 12 using rapid diagnostics. The other positive test during week 12 was performed using RT-PCR.

Week: 12 (March 17, 2013– March 23, 2013)	
No. of specimens tested Rapid Diagnostics	93
No. of positive specimens (%)	5 (5.4%)
Positive specimens by type/subtype	
Influenza A	1 (20%)
Influenza B	4 (80%)
Influenza A/B	0 (0%)
Influenza – unknown type	0 (0%)

INFLUENZA-LIKE ILLNESS (ILI) SURVEILLANCE

Sentinel surveillance for ILI consists of three outpatient reporting sites for the District of Columbia. The sentinel surveillance sites report the total number of ILI cases encountered per week and the total number of patients seen at the clinic during that same week. For this system, ILI is defined as the existence of fever (temperature of 100°F [37.8°C] or greater) and a cough and/or a sore throat in the absence of a known cause other than Influenza.

For week 12, sentinel providers reported that 0 out of 562 visits (0%) met the criteria for ILI.

Sentinel Surveillance ILI Activity for Washington, DC

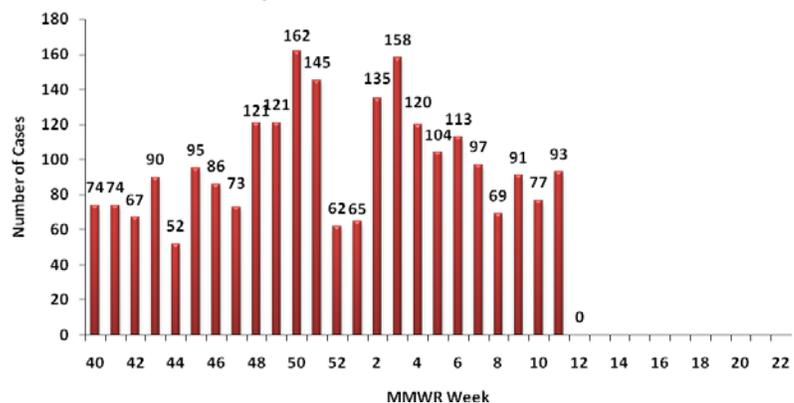

Week of	Activity *
March 17 – March 23	<i>Local</i>

***No Activity** – overall clinical activity remains low and there are no lab confirmed Influenza cases;

Sporadic – isolated lab confirmed Influenza cases reported and ILI activity is not increased;

Local – increased ILI activity and recent lab confirmed Influenza cases. As the District of Columbia is not a state, this is the highest level of ILI activity it can report.

Influenza-Like Illness Reported by MMWR Weekly September 30, 2012 - June 1, 2013

INFLUENZA TESTING BY THE DISTRICT OF COLUMBIA PUBLIC HEALTH LABORATORY (DC PHL)

The DC PHL subtypes human isolates to monitor the circulating strains of Influenza. The isolates are submitted to the DC PHL by hospitals and commercial laboratories. From October 1 – December 31, 2012, 25 out of 44 specimens sent to the DC PHL have tested positive for Influenza. Cumulatively, 22 of these isolates were subtyped as Influenza A/H3, one was subtyped as Influenza A/H1, and two were Influenza B.

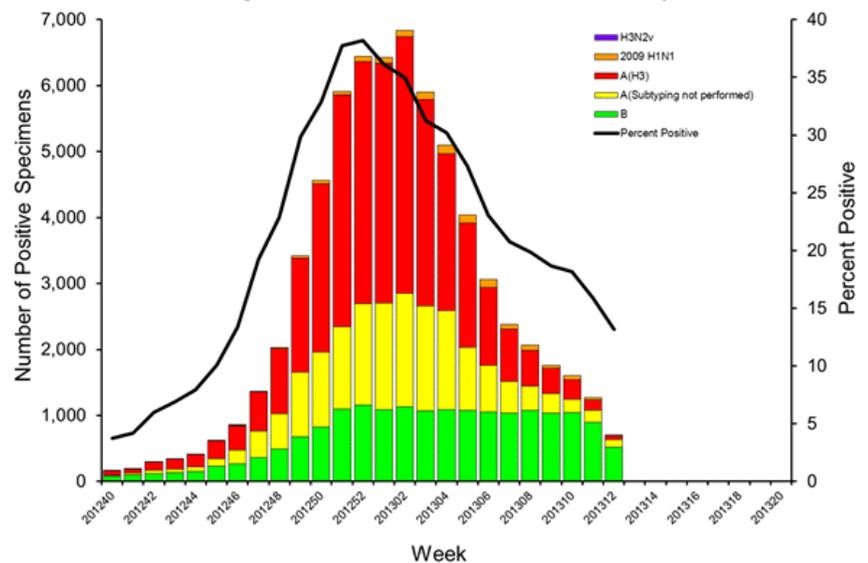

DC PHL Surveillance of Influenza Cases Reported By Influenza Subtype

DC PHL Influenza Testing	October 1- December 31, 2012
Number of specimens tested	44
◆ Number of specimens positive for Influenza:	25/44 (57%)
● Influenza A	23/25 (92%)
▪ H1	1/23 (4%)
▪ H3	22/23 (96%)
● Influenza B	2/25 (8%)

NATIONAL INFLUENZA ASSESSMENT

The CDC's weekly seasonal Influenza surveillance report for week 12 noted that Influenza-like illness (ILI) activity decreased in the United States. The proportion of outpatient visits for ILI was 1.8%, below the national baseline of 2.2%. The proportion of deaths due to Influenza and pneumonia in the US was at the epidemic threshold. Five Influenza-associated pediatric deaths were reported in the US, including one due to an Influenza A (H3) virus, two associated with Influenza A viruses that were not subtyped, and two due to Influenza B viruses. For the 2012-2013 Influenza season, a total of 110 pediatric deaths associated with influenza have been reported in the US. During week 12, 5,332 specimens were tested, of which 702 were positive (13.2%). Of the 702 that tested positive, 186 (26.5%) were Influenza A viruses and the remaining 516 (73.5%) were Influenza B viruses. Of the Influenza A samples, 61 (32.8%) were Influenza A/H3, 11 (5.9%) were Influenza A/2009 H1N1, and 114 (61.3%) of the viruses were not subtyped.

Influenza Positive Tests Reported to CDC by U.S. WHO/NREVSS Collaborating Laboratories, National Summary, 2012-13
